Dear InterWrap,

Team Fritz Clay Roof Tiles is a distributor of Clay Roof Tiles, imported directly from Europe. Our company works very closely with several large roofing contractors in and around central British Columbia, as it is a very specialized roofing system.

Last summer, during the devastating forest fires, which we experienced in Kelowna and the surrounding areas, several houses were burnt down, with absolutely nothing left standing! The GC's and Roofing Contractor's have been extremely busy, rebuilding and assisting the community. One such Roofing Company, Reid's Roofing, has been using our Clay roofing tiles in conjunction with **TITANIUM-UDL™** synthetic roofing underlayment.

Until this time, we were not familiar with synthetic underlayments, and asked Mr. Zais (owner of Reid's Roofing) why they used **TITANIUM-UDL™** over the standard 30# felt, we found most of our customers were using underneath our tile. Mr. Zais informed us he had been using the **UDL** for over a year now, as the benefits were significant (i.e. lightweight, quicker to install, safer walking conditions, UV exposure, etc...). However the most significant advantage for a Roofing Contractor to use **TITANIUM-UDL™**, especially under a tile roofing system is that UDL is non-biodegradable, which is great for tile roofs, as Team Fritz Clay Roof Tiles *offers a 50-year warranty on our products!* With the use of **TITANIUM-UDL™** as an underlayment, there will be no concern of product breakdown, one of the most significant disadvantages of using asphalt paper under tile roofs.

The long life of our clay roof tiles, complemented with **TITANIUM-UDL™** is a significant breakthrough for tile roofing systems! We hope in the future to have more and more jobs done using our tiles with your roofing underlayment!

Sincerely,

Soni Riediger
Sales Manager & Vice President
