# BioBlanket™

## Forest Residual Biomass Covers

BioBlanket™ from InterWrap® is a paper-based, scrim reinforced laminated cover used to keep forest residual biomass dry. Keeping biofuel piles from exposure to rain and snow decreases the moisture content in this woody biomass material – drier fuel means significantly more energy derived when burned. Strong, paper-based BioBlanket is easy to apply mechanically from a roll and is chipped and burned along with the forest residual.

**Rip Stop** is the reinforcing technology that protects the biomass cover from tearing easily during application to the pile.
